

Figure S1. Phylogenetic relationship of AGO proteins in different organisms. Proteins are discernible by species according to color and a two-letter prefix: Mo = Magnaporthe oryzae,Nc = Neurospora crassa,Mc = Mucor circinelloides, Sp = Schizosaccharomyces pombe, Cp = Cryphonectria parasitica, Ce = Caenorhabditis elegans, At = Arabidopsis thaliana, Dm = Drosophila melanogaster. Rhizophagus irregularis proteins are identified by JGI numeric codes. D. melanogaster, A. tahliana and C. elegans proteins are identified (after the two-letter prefix) by FunRNA (Choi et al. 2014) ID. Protein ID of other species (NCBI or JGI): MoAGO1 = XP_003716704.1, MoAGO2 = XP_003717504.1, MoAGO3 = XP_003714217.1, NcQDE-2 = XP_011394903.1, NcSMS-2 = EAA29350.1, SpAGO1 = O74957.1, McAGO-1 = 104161, McAGO-2 = 195366, McAGO-3 = 104163, CpAGL1 = ACY36939.1, CpAGL2 = ACY36940.1, CpAGL3 = ACY36941.1, CpAGL4 = ACY36942.1. The numbers at the nodes are bootstrap values (%) for 1000 replications. Figure was generated with Evolview v2.

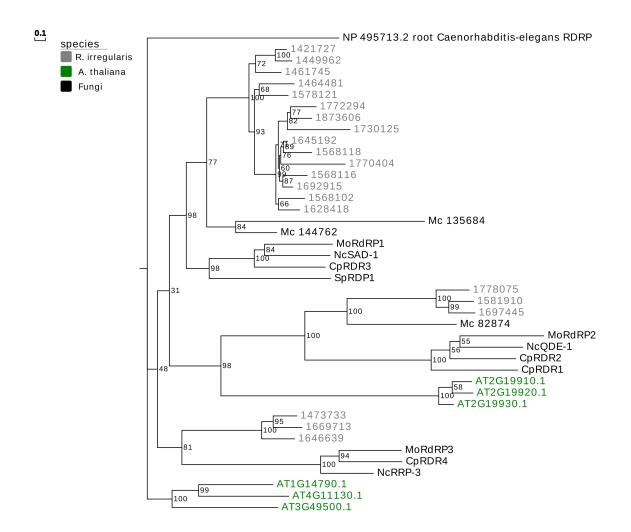

Figure S2. Phylogenetic relationship of RdRp proteins in different organisms. Proteins are discernible by species according to color and a two-letter prefix: Mo = *Magnaporthe oryzae*,Nc = *Neurospora crassa*,Mc = *Mucor circinelloides*, Sp = *Schizosaccharomyces pombe*, Cp = *Cryphonectria parasitica*, At = *Arabidopsis thaliana*. *Rhizophagus irregularis* proteins are identified by JGI numeric codes. *A. thaliana* proteins are identified (after the two-letter prefix) by FunRNA (Choi et al. 2014) ID. Protein ID of other species (NCBI or JGI): MoRdRP1= XP_003721007.1, MoRdRP2 = XP_003711624.1, MoRdRP3 = XP_003712093.1, NcQDE-1 = EAA29811.1, NcSAD-1 = XP_964248.3, NcRRP-3 = XP_963405.1, SpRDP1 = NP_001342838.1, McRdRP-1 = 111871, McRdRP-2 = 104159, CpRDR1 = 270014, CpRDR2 = 35624, CpRDR3 = 10929, CpRDR4= 339656. The numbers at the nodes are bootstrap values (%) for 1000 replications. Tree was rooted using *Arabidopsis thaliana* Argonaute 6 (NCBI Reference Sequence: NP_180853.2). Figure was generated with Evolview v2.

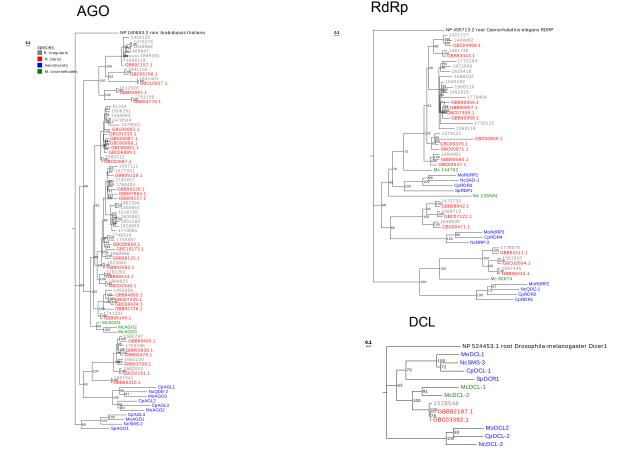

Figure S3. Phylogenetic relationship of AGO, RdRp and DCL proteins in different fungi. Proteins are discernible by species according to color and a two-letter prefix: Mo = Magnaporthe oryzae,Nc = Neurospora crassa, Mc = Mucor circinelloides, Sp = Schizosaccharomyces pombe, Cp = Cryphonectria parasitica. Rhizophagus irregularis proteins are identified by JGI numeric codes. Rhizophagus clarus proteins are identified with NCBI protein ID. Protein ID of other species (NCBI or JGI): MoAGO1 = XP_003716704.1, MoAGO2 = XP_003717504.1, MoAGO3 = XP_003714217.1, NcQDE-2 = XP_011394903.1, NcSMS-2 = EAA29350.1, SpAGO1 = O74957.1, McAGO-1 = 104161, McAGO-2 = 195366, McAGO-3 = 104163, CpAGL1 = ACY36939.1, CpAGL2 = ACY36940.1, CpAGL3 = ACY36941.1, CpAGL4 = ACY36942.1, MoRdRP1 = XP_003721007.1, MoRdRP2 = XP_003711624.1, MoRdRP3 = XP_003712093.1, NcQDE-1 = EAA29811.1, NcSAD-1 = XP_964248.3, NcRRP-3 = XP_963405.1, SpRDP1 = NP_001342838.1, McRdRP-1 = 111871, McRdRP-2 = 104159, CpRDR1 = 270014, CpRDR2 = 35624, CpRDR3 = 10929, CpRDR4= 339656, MoMDL1 = XP_003714515.1, MoMDL2 = XP_003715365.1, NcSMS-3 = XP_961898.1, NcDCL-2 = XP_963538.3, SpDCR1 = NP_588215.2, McDCL-1 = CAK32533.1, McDCL-2 = CAZ65730.1, CpDCL-1 = ABB00356.1, CpDCL-2 = ABB00357.1. Trees were rooted using: Arabidopsis thaliana Argonaute 6 (NCBI Reference Sequence: NP_180853.2) for AGO, Caenorhabditis elegans RdRP (NCBI Reference Sequence: NP_495713.2) for RdRp and Drosophila melanogster Dicer 1 (NCBI Reference Sequence: NP_524453.1) fro DCLThe numbers at the nodes are bootstrap values (%) for 1000 replications. Figure was generated with Evolview v2.

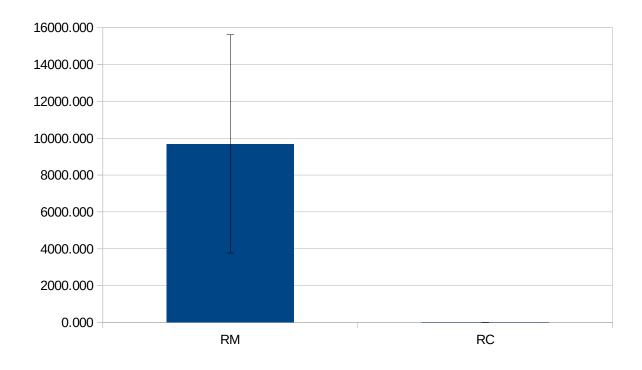

Figure S4. Expression of *MtPT4* relative to *MtTEF* assessed by qRT-PCR in RM samples (mycorrhizal roots) compared to RC ones (non-mycorrhizal roots). Data for each condition are presented as mean ± standard error.

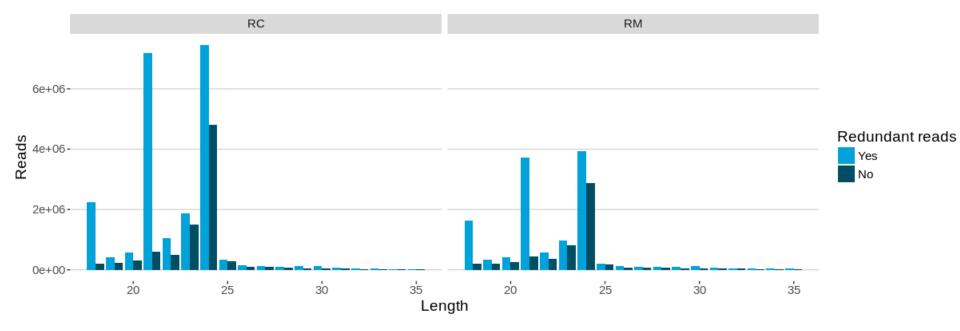

Figure S5. Length distribution (expressed in nucleotide) of sRNAs reads (redundant and non-redundant) from RC (non mycorrhizal roots) and RM (mycorrhizal roots) libraries mapping on *Medicago truncatula* genome.

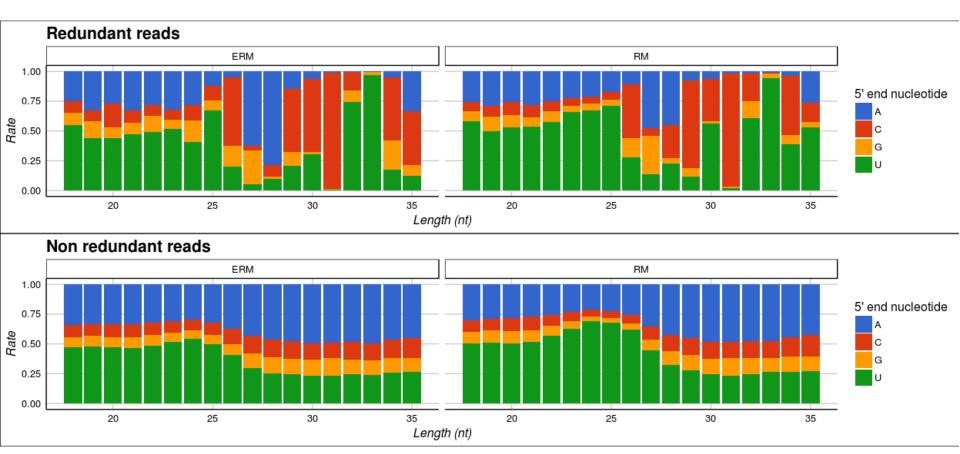

Figure S6. Relative nucleotide frequency of 5' end of sRNAs reads (redundant and non-redundant) from RM (mycorrhizal roots) and ERM (extra radical mycelium) libraries mapping on *Rhizophagus irregularis* genome.

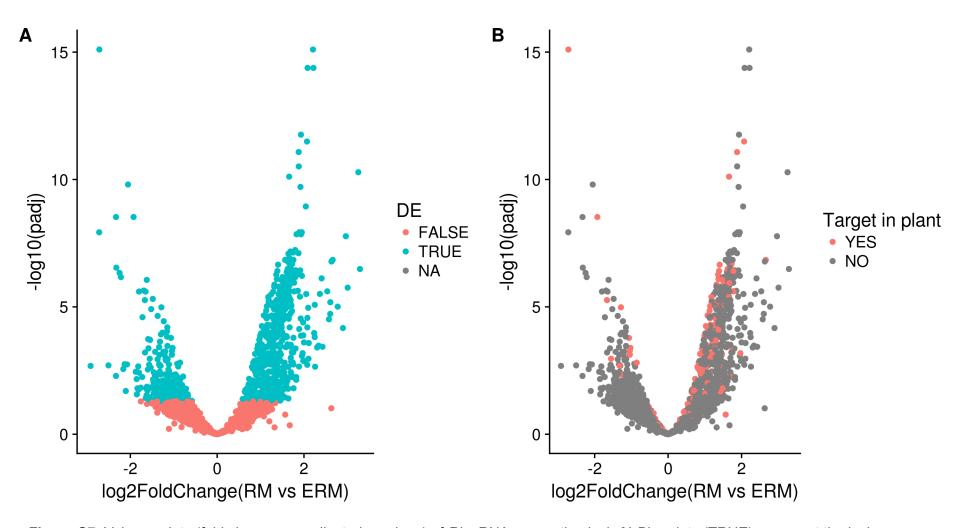

Figure S7. Volcano plots (fold changes vs adjusted p-values) of *Rir*-sRNA-generating loci. **A)** Blue dots (TRUE) represent the loci differentially expressed (adjusted p-values < 0.05) between between ERM (extra radical mycelium) and RM (mycorrhizal root) conditions according to DESeq2 analysis (DE = differentially expressed); **B)** Red dots (YES) represent the loci that produce *Rir*-sRNAs targeting *Mtr*-mRNAs, according to sPARTA analysis.

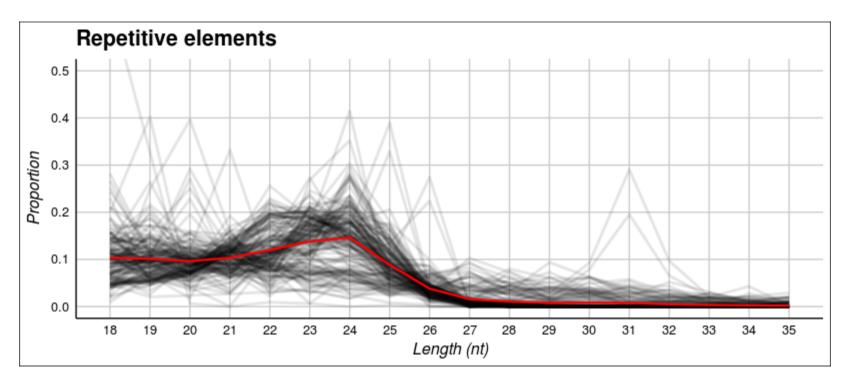

Figure S8. Length distribution (in nucleotide) of sRNA reads that defined the *Rir*-sRNAs-generating loci homologous to repetitive elements in RepBase. Black lines are the length distribution of the individual loci and red line is the average length distribution of the plotted loci.
